Under the leadership of Professor Jim Tielsch, who retired last November, the Hopkins community has seen a significant increase in research and collaboration. With the appointment of Professor Kate O’Brien, who was a key figure in the development of the Center, the Hopkins Global Center on Childhood Obesity has continued to make significant contributions to global health. The Center has been particularly active in the field of childhood obesity, with a focus on developing evidence-based interventions to prevent and treat this growing problem.

The Hopkins Global Center on Childhood Obesity continues to be a leader in the field, with a strong focus on research, education, and outreach. The Center is well-positioned to continue to make important contributions to global health and to the Hopkins community.

An important event was held at the Hopkins Global Center on Childhood Obesity to celebrate its first anniversary. The event was attended by representatives from the Hopkins community, as well as from other institutions and organizations. The event featured an array of speakers, including Dr. Robert Black, who presented a keynote address. The event was a great success, and it was clear that the Hopkins Global Center on Childhood Obesity is well poised to continue to make important contributions to global health.
