

# Impact Model Tool

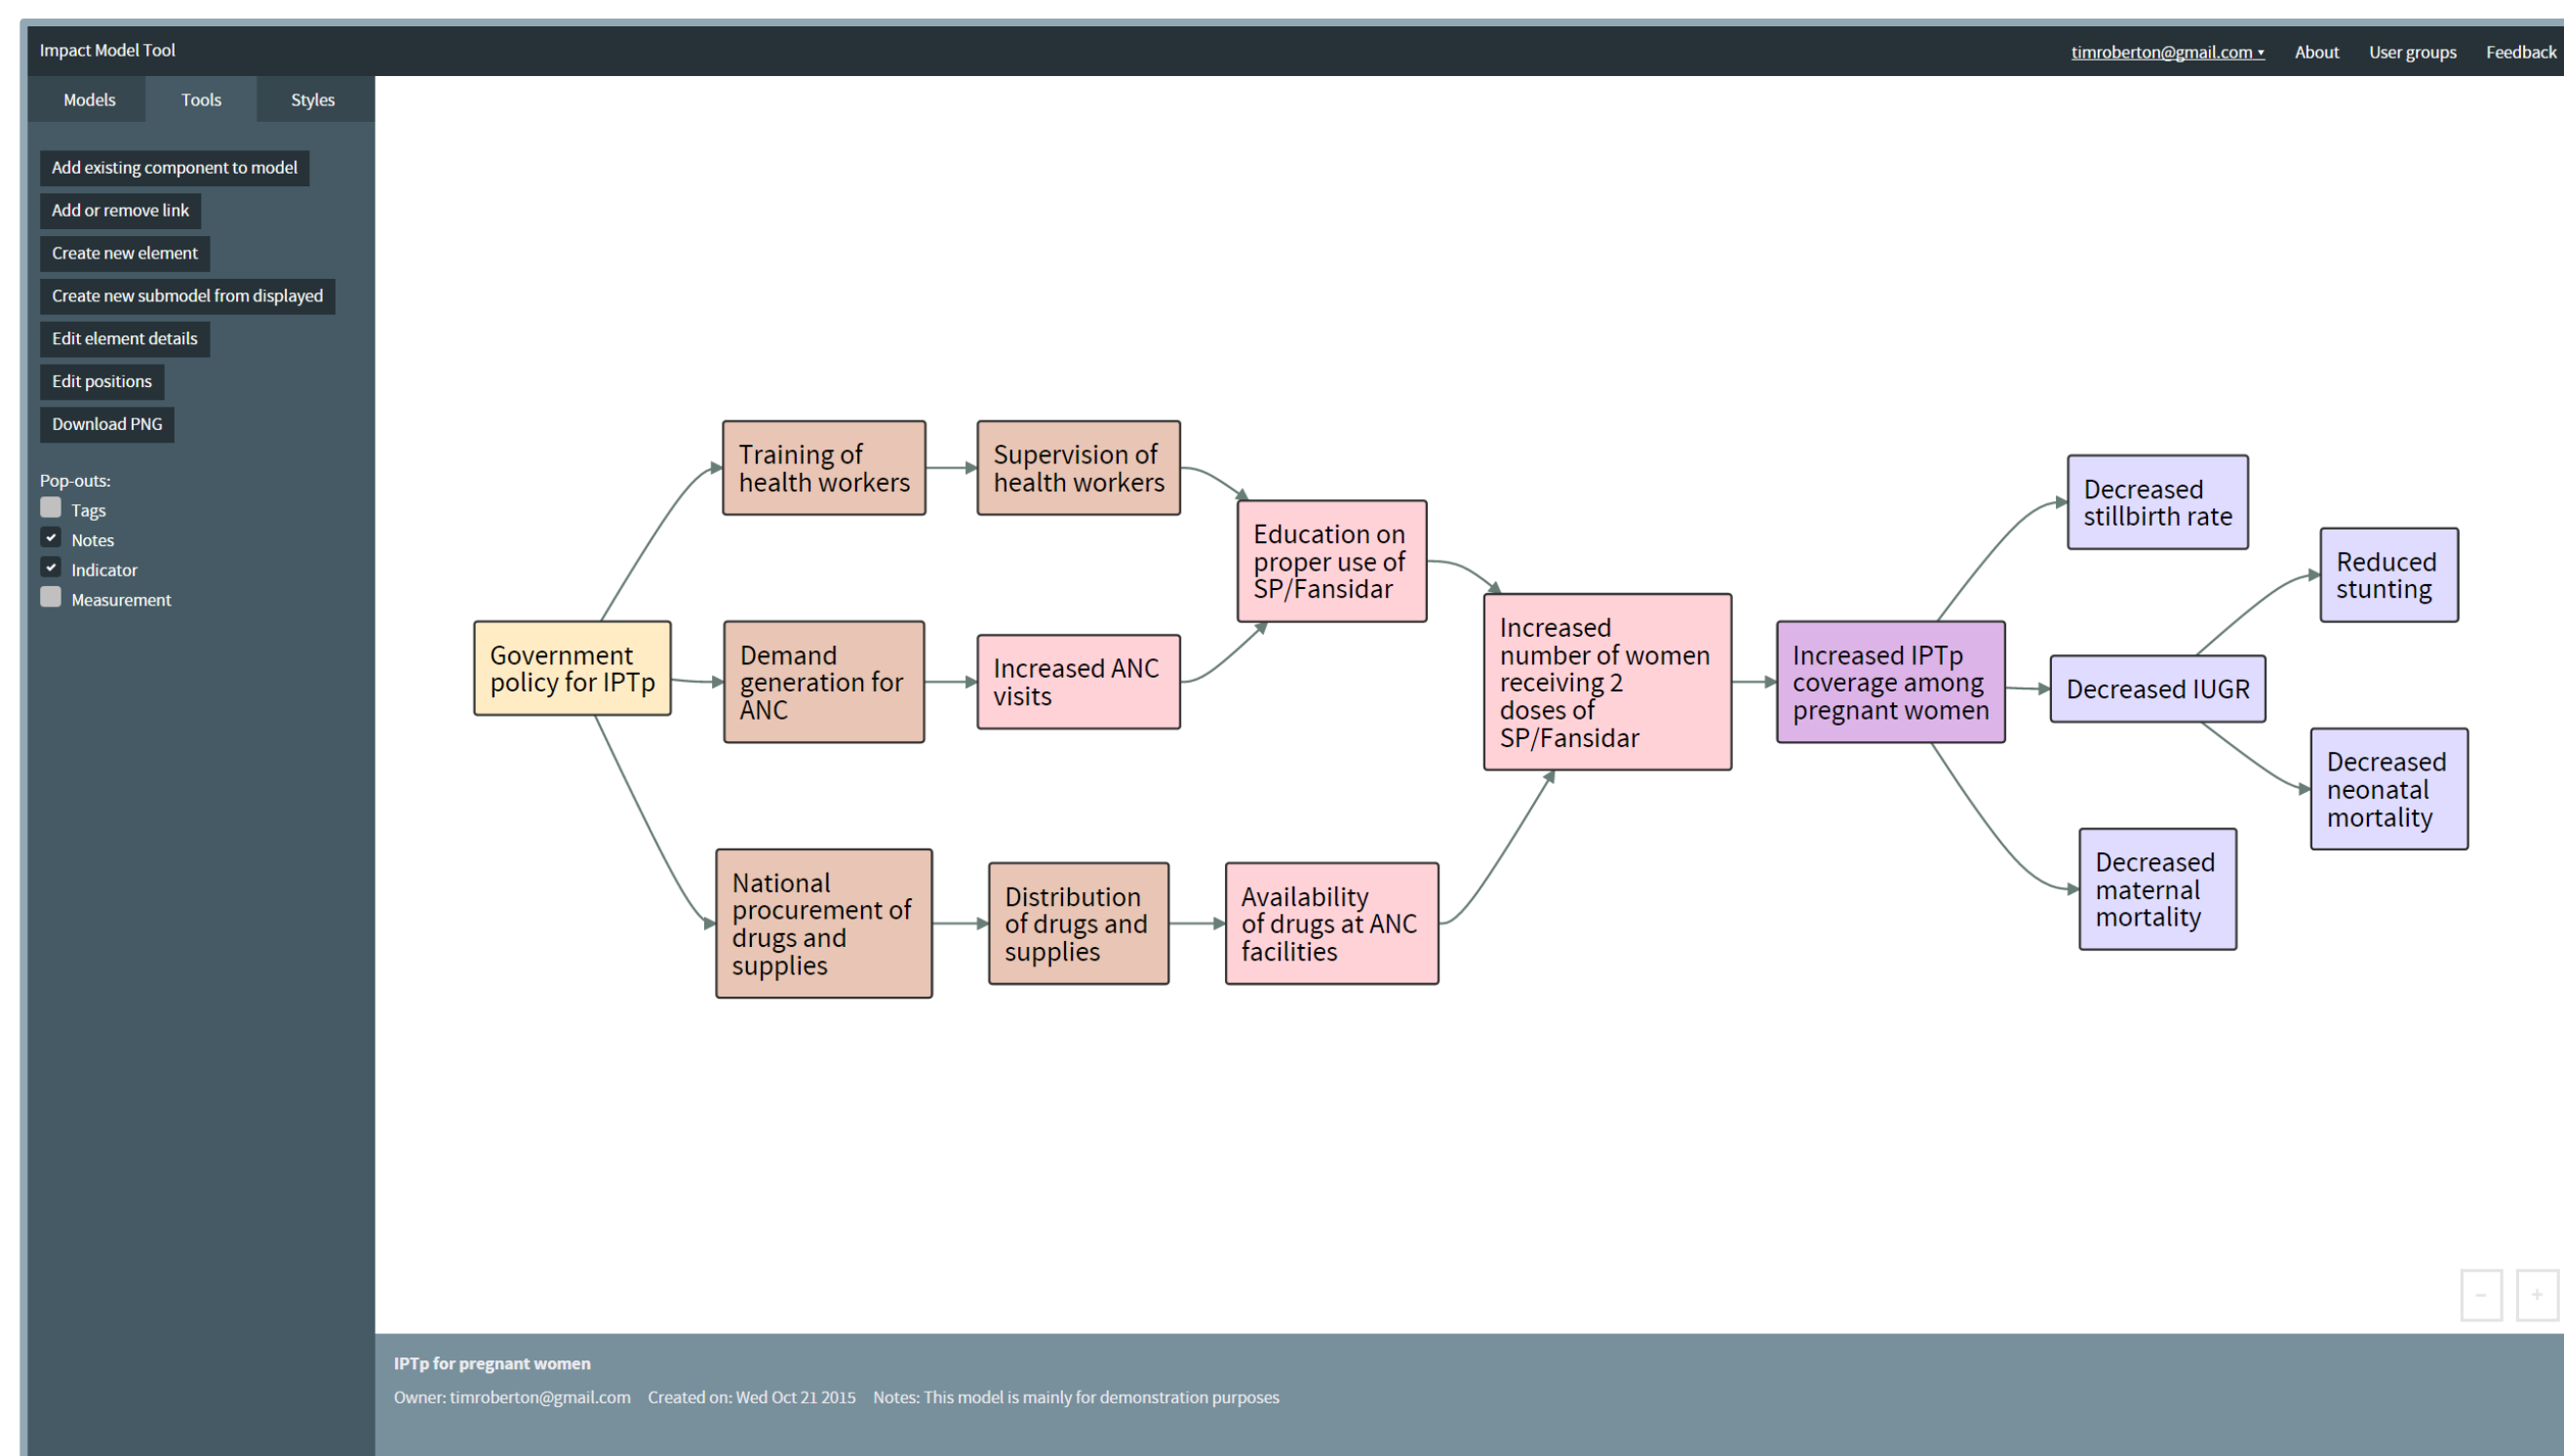

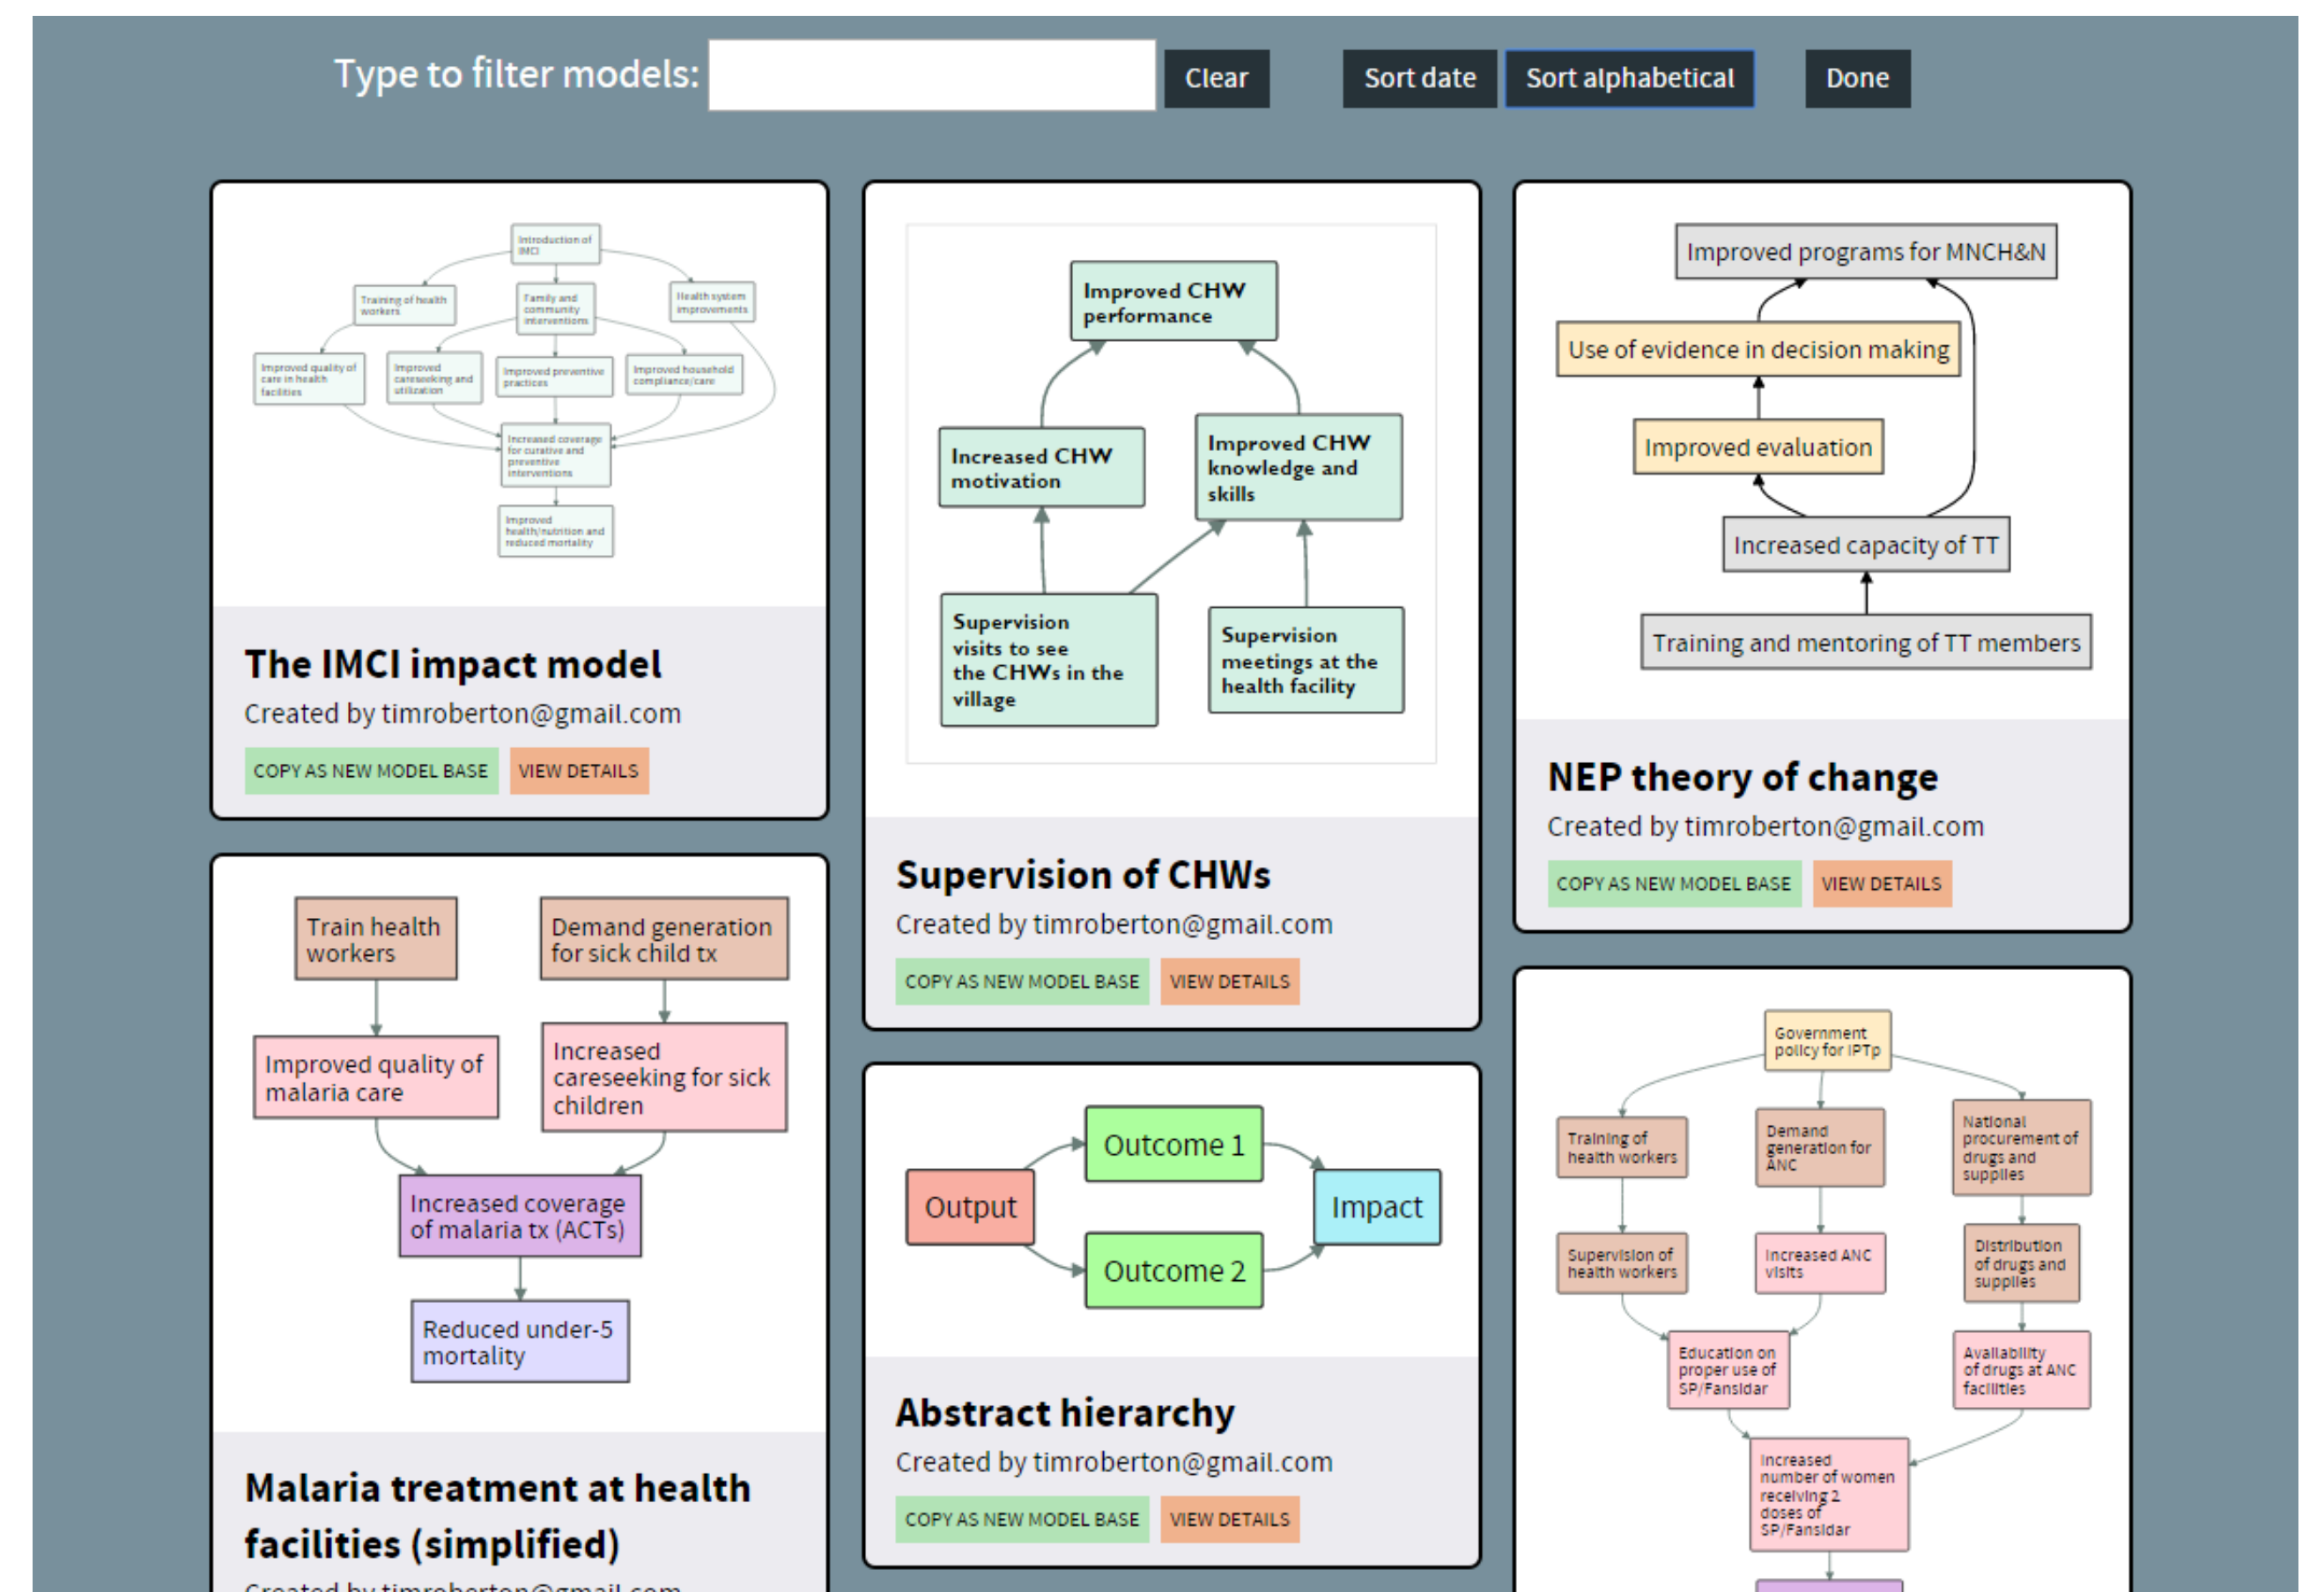

An interactive tool for building and sharing evidence-based models of change for health programs

Try it at: [impactmodeltool.org](http://impactmodeltool.org)

This RADAR tool helps users develop evidence-based models of change for their health programs.

Users can view libraries of impact models developed by technical experts, or build and share their own models with colleagues, donors, and other users around the world.

The tool highlights gaps in program logic that will limit effectiveness, guiding users to improve programs in the planning stage. Built-in information on core activities, outputs, and outcomes prompts users to develop robust monitoring and evaluation plans.

Create new impact models with standard or custom elements, using existing models or sub-models as a base.

Easily reformat and annotate models for planning, monitoring, evaluation, and reporting.

Customize styles, colors, layout, and interactivity.

Download impact models as high-resolution images.

View information on best practices for measuring program activities, outputs, outcomes, and impact.

Specify indicators, data sources, and targets for each element in a model.

Automatically compile and export an indicator table to form the basis of a monitoring and evaluation plan.
